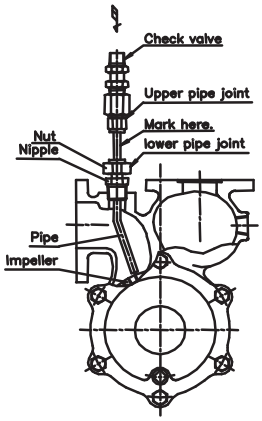
* In case of KTM80S / F model, connect “E” part with Bushing (3/4 x 3/8)



1) Loosen the nuts of the lower pipe joint to allow a nipple to freely move.
2) Mark the pipe bending direction on the pipe surface between the upper and lower pipe joints.
3) Wind a sealing tape around the lower pipe joint’s nipple of the suction nozzle, insert it into the nozzle junction of the pump, and turn the nipple to firmly fix it.
4) Turn the pipe to align the mark on the pipe surface so that the bend nose (gas discharge port) of the pipe will be directed to the center of the impeller.
5) Tighten the nuts of the lower pipe joint firmly. Make sure that the suction nozzle is not manually rotated.
6) Rotate the motor manually (rotate the shaft end of the motor with a screwdriver) to make sure that the pipe nose of the nozzle is not interfering with the impeller.

Excess Air Device / Separation Tank

The KTM Series pump user manual must be fully read and understood before operating the pump. Failure to do so may result in death, serious injury, or property damage. This page is intended for a basic understanding of the KTM startup operation and is not a substitute for the user manual.

PRE-OPERATION CHECK (POWER OFF)

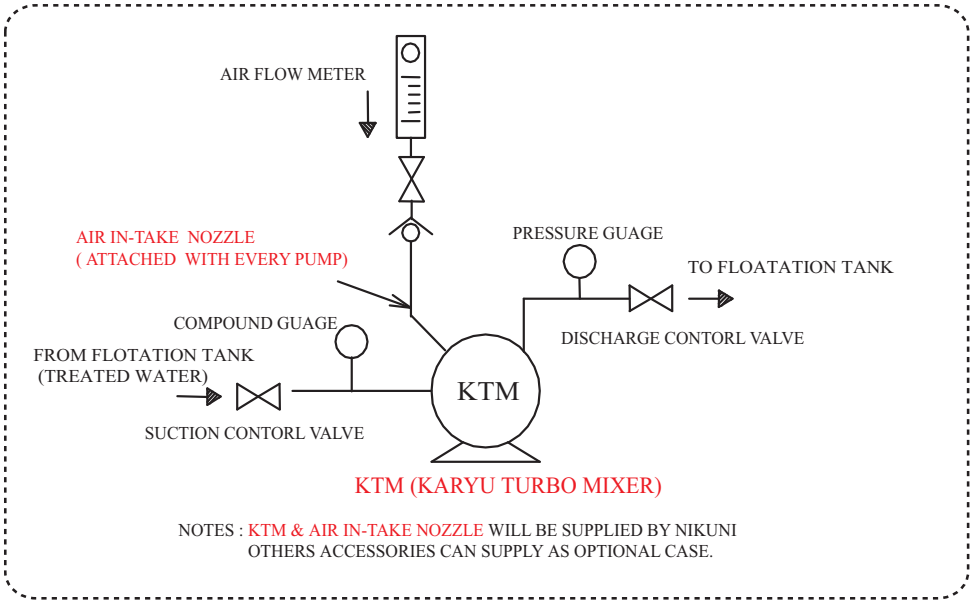
1) Prime KTM with effluent or water
2) Fully open Suction valve and Discharge valve. Do not run KTM with these valves closed.

STARTING THE KTM

1) Discharge side adjustments:
   Slowly tighten the Discharge valve until the discharge pressure falls within the desired range of 0.3MPa to 0.4Mpa (approximately 3 bar to 4 bar) with reference to the Pressure gauge.
   In the case where the Discharge valve (or KTM) is located far from the flotation tank, bubbles will tend to grow larger. In order to maintain microbubble size, an additional control valve should be installed on the flotation tank side to control the discharge pressure.

2) Suction side adjustments:
   Check to see if the Compound gauge indicates a negative suction pressure between the range of -0.02MPa to -0.03MPa (approximately -0.2 bar to -0.3 bar). If the pressure is higher than this range, slightly tighten the Suction valve to bring the pressure into the range stated above.

3) Air injection adjustments:
   Open the knob of Air-Parameter (Air flow meter) and adjust to an air flow rate that is 8% of the water flow rate.



In case of mini bubbles occur and effect to flotation process,
please consider installing Excess Air Device / Separation Tank as shown in next page.
